

Directions for Tweakerizer

1. Before you run the Tweakerizer, you need to have installed the corresponding regular Forceware Driver and Restarted Windows (see below if you need instructions)
2. Run the Tweakerizer
3. If you wish to generate an Undo File so you can restore to a Pre-Tweakerized state, check that option.
4. Press "Install Tweaks"
5. Select the corresponding .xgt file
6. Press "Open" (NOTE: in this Beta version you'll need to press ok for several debug messages.)
7. When "All Tweaks Installed" is displayed, press OK and close the Tweakerizer
8. Restarting Windows at this point is recommended but not mandatory
9. Enjoy!!

To Restore to a Pre-Tweakerized state press restore and select the desired restore point. It is also possible and advisable to delete old Restore Points.

Directions for Proper Uninstallation and Installation of Graphics Card Drivers

There are countless cases, here, where people that didn't follow this procedure had problems and then did follow this method and their problems disappeared.

General Video Driver Uninstall/Install

(before reading this, download and install DriverCleanerPro from <http://www.drivercleaner.net/>)

1. Unplug nic card or modem from net or disconnect. (I never do this)
2. Disable any AntiVirus Software. If you don't disable, it could give you trouble. (This either)
3. Uninstall current vid driver (If you have an nVidia mobo and a nVidia vidcard, make sure you only uninstall the video driver, not all nVidia drivers or your mobo will lose its drivers also.)
4. Reboot
5. As the reboot comes up, after the quick memory test and hard drives have been recognized, hit F8 and enter "SAFE MODE." On some boards if you hit F8 too early you will enter other utilities.
6. On reboot into safe mode WinXP SP1/SP2 will auto detect and ask you to install drivers. You should be able to can cancel out of the auto install hardware wizard move to step #7. If you can NOT cancel out of auto detect wizard then, navigate to device manager->display adapters->highlight (nVidia, ATI, etc.) and click uninstall or remove but don't reboot. (From Driver Cleaner ReadMe, modified for clarity by Rike)
7. Run Driver Cleaner with the filter for the driver (nVidia, ATI, etc.) you just uninstalled . Quit DriverCleaner and restart into Windows XP normal mode.
8. Install new Video driver. Note for SLI users: sometimes the driver doesn't install for both cards. To ensure proper installation, you should check in Device Manager to be sure the driver is installed for both cards. If it isn't, you should right-click on the yellow-question-marked card and click on Update Driver.
- 9.. Empty the recycle bin and Reboot
10. Redo what was undone in #2 & #1, in that order. Reboot if needed to re-establish Internet connection.
11. Enjoy
